Attorney's Docket No.: 12758-
059US1 / 1998P02452WOUS

AMENDMENTS TO THE SPECIFICATION:

Please add the following paragraph before the paragraph beginning at page 1, line 5:

RELATED APPLICATIONS

This application claims priority to PCT Application PCT/DE99/02651, filed on August 24, 1999, which claims priority to German Application No. 198 39 634.1, August 31, 1998.

Please amend the paragraph beginning on page 2, line 26 with the following paragraph:

The previously mentioned object is achieved ~~according to the present invention~~ by a telecommunications installation ~~comprising:~~ which includes a control computer to control ~~said~~ the telecommunications installation, ~~said~~ the control computer ~~comprising:~~ includes a memory to store control software and work data, ~~said~~ the memory ~~comprising~~ includes ~~a plurality of~~ memory areas, specific control software being allocated to ~~each said~~ the memory area, and in that ~~said~~ the control software of one of ~~said plurality of~~ the memory areas is ~~declared~~ designated to be active control software and ~~said~~ the control software of other memory areas is ~~declared~~ designated to be passive control software, so that ~~said~~ the control computer controls ~~said~~ the telecommunications installation according to ~~said~~ the active control software. In the telecommunications installation, specific work data, which are stored by ~~said~~ the memory, may be allocated to each control software package, ~~said~~ the work data allocated to ~~said~~ the active control software being ~~declared~~ designated to be active work data and ~~said~~ the other work data are ~~declared~~ designated to be passive work data, so that ~~said~~ the control computer controls ~~said~~ the telecommunications installation according to ~~said~~ the active control software and ~~said~~ the

Attorney's Docket No.: 12758-
059US1 / 1998P02452WOUS

active work data. The memory may ~~comprise~~ include two memory areas to which specific

control software and specific work data are in each case allocated. In the invention the two

memory areas may ~~comprise~~ include identical control software and identical work data, and, in

the event of a fault during control of ~~said~~ the telecommunications installation, control computer

switches over to and activates previously passive control software and previously passive work

data and deactivates ~~said~~ the previously active control software and ~~said~~ the previously active

work data, in order to subsequently control said telecommunications installations according to

newly activated control software and newly activated work data. In the event of a fault during

~~said~~ the control of the telecommunications installation, and by way of menu-driven operating

intervention, ~~said~~ the control computer may switch over to activate ~~said~~ the previously active

control software and ~~said~~ the previously active work data. In the event of a fault during said

control of ~~said~~ the telecommunications installation, ~~said~~ the control computer temporarily can

transfer to a pause condition before switching over to ~~said~~ the previously passive control

software and ~~said~~ the previously active work data. During re-installation of control software,

~~said~~ the control computer may continue to control ~~said~~ the telecommunications installation

according to ~~said~~ the active control software; or may temporarily ~~switches~~ switch to ~~said~~ the

passive memory area containing ~~said~~ the passive control software, in order to install a new work

database therein. During a changeover from ~~said~~ the active memory area and corresponding

control software and corresponding work data to ~~said~~ the other memory area and corresponding

control software and corresponding work data, ~~said~~ the control computer may evaluate, with

reference to stored control information, whether only ~~said~~ the control software or else ~~said~~ the

work data or else a further control computer are affected by ~~said~~ the changeover and, depending on this evaluation, automatically initiate a restoration of ~~said~~ the telecommunications installation. Finally, in the inventive telecommunications installation, the control computer may include ~~comprise~~ an input device to enter control information which declares control software and work data of individual memory areas of ~~said~~ the memory to be either active or passive. ~~The invention is explained in more detail below.~~

Please replace the abstract on page 12 with the following new abstract:

A system for installing telecommunications software includes a control computer to control the installation of telecommunications software. The control computer includes a memory to store control software and work data. The memory includes memory areas and specific control software is allocated to at least two memory areas. The control software of one of the at least two memory areas including active control software and the control software of other of the at least two memory areas including passive control software. The control computer controls the installation of the telecommunications software using the active control software.
